Jahez iOS QA: Test Plan and Test Summary Report

Personal independent QA project (not an official company engagement). Tester: Norah K. Alshdoukhi. Dates: 28/10/2026 to 29/10/2026.

Part 1: Test Plan

1. Objective

Verify the quality of core functions and user experience of the Jahez food-delivery app on iOS, and document defects in Jira.

2. In scope

Login and registration (including guest mode), search and browsing (Food and Groceries), restaurant page and menu, cart and coupons, addresses, settings (language and notifications), and non-functional checks (rotation, weak or no network, permissions, UX, RTL).

3. Out of scope

Placing a real order or payment, security and load testing, restaurant dashboard and driver app, Android (planned for a later phase), Fawasel, Jahez Alkhair and in-app video ads.

4. Test environment

- Device: iPhone 16 Pro Max
- iOS: 18.7.8
- App builds: 429 (main run), 429.1 (regression)
- Connection: mobile data for the main run, Wi-Fi for regression and exploratory work
- Default language: English

5. Approach

Manual testing based on written test cases, plus a short exploratory session and a regression round.

6. Deliverables

40 test cases (priority 1: TC-01 to TC-30, priority 2: TC-31 to TC-40), defects in Jira, a regression round, and a one-page summary report.

7. Entry criteria

App installs and runs, a test account is available, and an internet connection is available.

8. Exit criteria

All planned cases executed or justified (N/A or Blocked), every defect documented, and the regression round completed.

9. Risks

- App updates during testing may change results.
- Available restaurants and offers vary by location and time.
- Verification code attempts are limited, so at most one or two wrong attempts were used.

Part 2: Test Summary Report

1. General information

- App: Jahez, platform iOS only
- Device: iPhone 16 Pro Max, iOS 18.7.8
- Builds tested: 429 (main execution) and 429.1 (regression)
- Type: manual testing
- Period: 28/10/2026 to 29/10/2026

2. Results

Metric	Count
Test cases written	40
Pass	37
Fail	0
N/A	2 (TC-11 no Sort option, TC-23 no address editing)
Blocked	1 (TC-30, no weak network available)
Exploratory ideas	9
Regression (build 429.1)	10 of 10 Pass
Bug re-test	KAN-4 still reproducible

3. Defects

KAN-4 (Bug, Priority Low, Severity Minor): there is no upper limit on item quantity in the cart. Quantity reached 313 on build 429 and 54 on build 429.1 with no limit or message. This may be intended behavior and needs product confirmation. Screen recording attached in Jira.

4. Observations

- KAN-5: a long unrelated search text returns results instead of “No results”.
- KAN-6: the phone field accepts pasted letters and rejects them only on Continue.
- KAN-7: saved addresses cannot be edited, only deleted.
- KAN-8: no in-app indication when iOS notifications are disabled.
- Not logged in Jira: the bottom navigation bar changes when entering Shops (seen on 429.1, not compared with 429, likely by design). Addresses appear at checkout, not under More.

5. Limitations

- Weak-network behavior was not tested (TC-30 blocked).

- Android was not tested (later phase).
- No order or payment was placed, by decision.
- Regression covered 10 cases only.

6. Conclusion

No functional failure was found in the tested flows. One low-severity defect remains open. The app was stable within the defined scope.
